

Introduction

Paragraph ONE describes the source of the data. Independent evaluation requires clearly defined participants and a frozen protocol. The available images were grouped by their original source. The dataset release and selection criteria are stated before any model is trained. This paragraph is about data provenance.

Paragraph TWO describes architecture and baseline comparisons. A strong baseline matters because a change in architecture may also change training conditions. Two separately configured segmentation pipelines were compared under the same frozen evaluation rules. This paragraph is about architectural comparisons.

Paragraph THREE describes an automatic prompting pipeline. Prompts came from baseline predictions rather than manual selection. Empty and inaccurate proposals were retained in evaluation. The resulting score therefore reflects both proposal quality and the downstream segmentation model. This paragraph is about prompts and failures.

Paragraph FOUR describes external testing. Different acquisition conditions and annotation protocols can change measured performance. Separate external cohorts were analysed separately, and uncertainty was reported alongside estimates. This paragraph is about external evaluation.

Two-column evaluation

LEFT paragraph 1 is independent of the right column. This text is used to verify the reading order and the highlight region. It must stay within the left column.

LEFT paragraph 2 is independent of the right column. This text is used to verify the reading order and the highlight region. It must stay within the left column.

LEFT paragraph 3 is independent of the right column. This text is used to verify the reading order and the highlight region. It must stay within the left column.

RIGHT paragraph 1 is independent of the left column. This text is used to verify that separate columns do not get merged into one source paragraph.

RIGHT paragraph 2 is independent of the left column. This text is used to verify that separate columns do not get merged into one source paragraph.

RIGHT paragraph 3 is independent of the left column. This text is used to verify that separate columns do not get merged into one source paragraph.
